 - System class
 - Simple example
- Distributions as solutions
 - Review: classical distribution theory
 - Restriction of distributions
 - Piecewise smooth distributions
- Solution theory for switched DAEs
- Impulse and jump freeness of solutions

DAE = Differential algebraic equation

Homogeneous switched linear DAE

$$E_{\sigma(t)}\dot{x}(t) = A_{\sigma(t)}x(t)$$
 (swDAE)

or short $E_{\sigma}\dot{x} = A_{\sigma}x$

with

- Switching signal $\sigma: \mathbb{R} \to \{1, 2, \dots, N\}$
 - piecewise constant, right continuous
 - locally finitely many jumps
- matrix pairs $(E_1, A_1), \ldots, (E_N, A_N)$
 - $E_p, A_p \in \mathbb{R}^{n \times n}$, $p = 1, \ldots, N$
 - (E_p, A_p) regular, i.e. $det(E_p s A_p) \not\equiv 0$
 - or more general: $E_p, A_p \in (\mathcal{C}^{\infty})^{n \times n}$

Why switched DAEs $E_{\sigma}\dot{x} = A_{\sigma}x$?

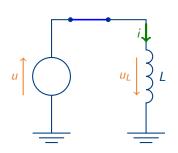

- Modelling electrical circuits
- 2 DAEs $E\dot{x} = Ax + Bu$ with switched feedback

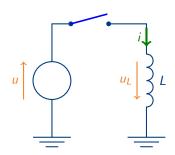

$$u(t) = F_{\sigma(t)}x(t)$$
 or $u(t) = F_{\sigma(t)}x(t) + G_{\sigma(t)}\dot{x}(t)$

1 Approximation of time-varying DAEs $E(t)\dot{x} = A(t)x$ by piecewise-constant DAEs

Questions

- 1) Solution theory
- 2) Impulse free solutions
- 3) Stability

$$E_1 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & L & 0 \\ 0 & 0 & 0 \end{bmatrix} \quad A_1 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 1 \end{bmatrix} \qquad E_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & L & 0 \\ 0 & 0 & 0 \end{bmatrix} \quad A_2 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

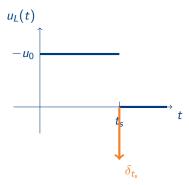

Introduction

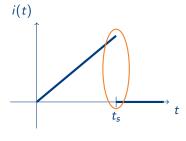

0000

$$\dot{u} = 0$$
, $L \frac{d}{dt} i = u_L$, $0 = u + u_L$ or $0 = i_L$

Assume:
$$u(0) = u_0$$
, $i(0) = 0$

switch at
$$t_s > 0$$
: $\sigma(t) = \begin{cases} 1, & t < t_s \\ 2, & t \geq t_s \end{cases}$

Distributions - overview

- Generalized functions
- Arbitrarily often differentiable
- ullet Dirac-Impulse δ_0 is "derivative" of jump function $\mathbb{1}_{[0,\infty)}$

Two different formal approaches

- Functional analytical: Dual space of the space of test functions (L. Schwartz 1950)
- Axiomatic: Space of all "derivatives" of continuous functions (J.S. Silva 1954)

Definition (Test functions)

 $\mathcal{C}_0^{\infty} := \{ \varphi : \mathbb{R} \to \mathbb{R} \mid \varphi \text{ is smooth with compact support } \}$

Definition (Distributions)

 $\mathbb{D}:=\{\ D:\mathcal{C}_0^\infty\to\mathbb{R}\ |\ D\ \text{is linear and } \text{continuous}\ \}$

Definition (Regular distributions)

 $f \in L_{1,loc}(\mathbb{R} \to \mathbb{R})$: $f_{\mathbb{D}} : \mathcal{C}_0^{\infty} \to \mathbb{R}, \ \varphi \mapsto \int_{\mathbb{R}} f(t)\varphi(t)dt \in \mathbb{D}$

Definition (Derivative)

 $D'(\varphi) := -D(\varphi')$

Dirac Impulse at $t_0 \in \mathbb{R}$

 $\delta_{t_0}: \mathcal{C}_0^{\infty} \to \mathbb{R}, \quad \varphi \mapsto \varphi(t_0)$

Definition (Multiplication with smooth functions)

$$\alpha \in \mathcal{C}^{\infty} : (\alpha D)(\varphi) := D(\alpha \varphi)$$

(swDAE)
$$E_{\sigma}\dot{x} = A_{\sigma}x$$

Coefficients not smooth

Problem: $E_{\sigma}, A_{\sigma} \notin \mathcal{C}^{\infty}$

Observation:

$$\begin{array}{ll} E_{\sigma}\dot{x} = A_{\sigma}x \\ i \in \mathbb{Z}: \ \sigma_{[t_i,t_{i+1})} \equiv p_i \end{array} \Leftrightarrow \forall i \in \mathbb{Z}: \ (E_{p_i}\dot{x})_{[t_i,t_{i+1})} = (A_{p_i}x)_{[t_i,t_{i+1})} \end{array}$$

New question: Restriction of distributions

Distributional restriction:

$$\{ M \subseteq \mathbb{R} \mid M \text{ interval } \} \times \mathbb{D} \to \mathbb{D}, \quad (M, D) \mapsto D_M$$

and for each interval $M \subseteq \mathbb{R}$

- $lackbox{0} D \mapsto D_M$ is a projection (linear and idempotent)

- **9** $(M_i)_{i\in\mathbb{N}}$ pairwise disjoint, $M=\bigcup_{i\in\mathbb{N}}M_i$:

$$D_{M_1 \cup M_2} = D_{M_1} + D_{M_2}, \quad D_M = \sum_{i \in \mathbb{N}} D_{M_i}, \quad (D_{M_1})_{M_2} = 0$$

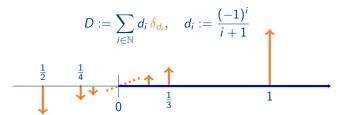

Theorem

Such a distributional restriction does not exist.

1

Proof of non-existence of restriction

Consider the following distribution(!):

Properties 2 and 3 give

$$D_{(0,\infty)} = \sum_{k \in \mathbb{N}} d_{2k} \, \delta_{d_{2k}}$$

Choose $\varphi \in \mathcal{C}_0^{\infty}$ such that $\varphi_{[0,1]} \equiv 1$:

$$D_{(0,\infty)}(\varphi) = \sum_{k \in \mathbb{N}} d_{2k} = \sum_{k \in \mathbb{N}} \frac{1}{2k+1} = \infty$$

Switched DAEs

- Examples: distributional solutions
- Multiplication with non-smooth coefficients
- Or: Restriction on intervals

Distributions

- Distributional restriction not possible
- Multiplication with non-smooth coefficients not possible
- Initial value problems cannot be formulated

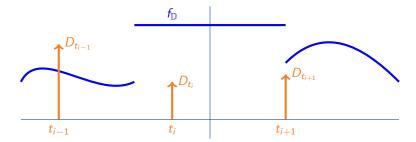

Underlying problem

Space of distributions too big.

Define a suitable smaller space:

Definition (Piecewise smooth distributions $\mathbb{D}_{pwC^{\infty}}$)

$$\mathbb{D}_{\mathsf{pw}\mathcal{C}^{\infty}} := \left\{ \begin{array}{c|c} f_{\mathbb{D}} + \sum_{t \in \mathcal{T}} D_{t} & f \in \mathcal{C}^{\infty}_{\mathsf{pw}}, \\ T \subseteq \mathbb{R} \text{ locally finite}, \\ \forall t \in \mathcal{T} : D_{t} = \sum_{i=0}^{n_{t}} a_{i}^{t} \delta_{t}^{(i)} \end{array} \right\}$$

1

Properties of $\mathbb{D}_{pw\mathcal{C}^{\infty}}$

- \bullet $\mathcal{C}^{\infty}_{\mathsf{pw}}$ " \subseteq " $\mathbb{D}_{\mathsf{pw}}\mathcal{C}^{\infty}$
- $\bullet \ \ D \in \mathbb{D}_{\mathsf{pw}\mathcal{C}^{\infty}} \Rightarrow D' \in \mathbb{D}_{\mathsf{pw}\mathcal{C}^{\infty}}$
- Restriction $\mathbb{D}_{pw\mathcal{C}^{\infty}} \to \mathbb{D}_{pw\mathcal{C}^{\infty}}$, $D \mapsto D_M$ for all intervals $M \subseteq \mathbb{R}$ well defined
- ullet Multiplication with $\mathcal{C}^\infty_{\mathsf{pw}}$ -functions well defined
- Left and right sided evaluation at $t \in \mathbb{R}$: D(t-), D(t+)
- Impulse at $t \in \mathbb{R}$: D[t]

(swDAE)
$$E_{\sigma}\dot{x} = A_{\sigma}x$$

Application to (swDAE)

 $x \text{ solves (swDAE)} \quad :\Leftrightarrow \quad x \in (\mathbb{D}_{pw\mathcal{C}^{\infty}})^n \text{ and (swDAE) holds in } \mathbb{D}_{pw\mathcal{C}^{\infty}}$

1

Relevant questions

Consider $E_{\sigma}\dot{x} = A_{\sigma}x$ with regular matrix pairs E_p, A_p .

- Existence of solutions?
- Uniqueness of solutions?
- Inconsistent initial value problems?
- Jumps and impulses in solutions?
- Conditions for jump and impulse free solutions?

Theorem (Existence and uniqueness)

$$\forall x^0 \in (\mathbb{D}_{pw\mathcal{C}^{\infty}})^n \ \forall t_0 \in \mathbb{R} \ \exists ! x \in (\mathbb{D}_{pw\mathcal{C}^{\infty}})^n$$
:

$$x_{(-\infty,t_0)} = x^0_{(-\infty,t_0)}$$
$$(E_{\sigma}\dot{x})_{[t_0,\infty)} = (A_{\sigma}x)_{[t_0,\infty)}$$

Remark: x is called *consistent solution* : \Leftrightarrow $E_{\sigma}\dot{x} = A_{\sigma}x$ on whole \mathbb{R} .

 - Restriction of distributions
 - Piecewise smooth distributions
- 3 Solution theory for switched DAEs
- Impulse and jump freeness of solutions

For (E_i, A_i) choose S_i, T_i invertible such that (Quasi-Weierstraß form)

$$(S_i E_i T_i, S_i A_i T_i) = \left(\begin{bmatrix} I & 0 \\ 0 & N_i \end{bmatrix}, \begin{bmatrix} J_i & 0 \\ 0 & I \end{bmatrix} \right)$$

Definition (Consistency projectors)

$$\Pi_i := T_i \begin{bmatrix} I & 0 \\ 0 & 0 \end{bmatrix} T_i^{-1}$$

Theorem

For all solutions x of (swDAE):

$$x(t+) = \Pi_{\sigma(t)}x(t-)$$

Theorem (Impulse freeness)

If for (swDAE)

$$\forall p,q \in \{1,\ldots,N\} : E_p(I-\Pi_p)\Pi_q = 0,$$

then all consistent solutions $x \in (\mathbb{D}_{pwC^{\infty}})$ are impulse free.

Basic idea of proof:

$$x(t+)-x(t-)\in \operatorname{im}(I-\Pi_{\rho})\Pi_{q} \text{ and } E_{\rho}\dot{x}[t]=0 \quad \Rightarrow \quad x[t]=0.$$

Theorem (Jump freeness)

If for (swDAE)

$$\forall p,q \in \{1,\ldots,N\} : (I-\Pi_p)\Pi_q = 0,$$

then all consistent solutions $x \in (\mathbb{D}_{pw\mathcal{C}^{\infty}})$ are jump and impulse free.

$$(E_1, A_1) = \begin{pmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & L & 0 \\ 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 1 \end{bmatrix} \end{pmatrix} \quad \Rightarrow \quad \Pi_1 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$$

$$(E_2, A_2) = \begin{pmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & L & 0 \\ 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \end{pmatrix} \quad \Rightarrow \quad \Pi_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Jumps?
$$(I - \Pi_1)\Pi_2 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 1 & 0 & 0 \end{bmatrix}$$
, $(I - \Pi_1)\Pi_2 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$

Impulses?
$$E_1(I - \Pi_1)\Pi_2 = 0$$
, $E_2(I - \Pi_2)\Pi_1 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & L & 0 \\ 0 & 0 & 0 \end{bmatrix}$

Conclusion:

- Motivation for switched DAEs
- Distributional solution: Needed, but impossible
- Solution: Piecewise-smooth distributions
- Applications of solution theory: Conditions for impulse freeness of solutions

Outlook and further results

- ullet Multiplication defined for $\mathbb{D}_{\mathsf{pw}\mathcal{C}^{\infty}}$, e.g. ${\delta_t}^2=0$
- DAEs $E\dot{x}=Ax+f$ with distributional coefficients can be studied, e.g. $\dot{x}=\delta_0x$
- Stability results
